a comprehensive guide to the conceptual mathematical and implementational aspects of analyzing electrical brain signals including data from meg eeg and lfp recordings this book offers a comprehensive guide to the theory and practice of analyzing electrical brain signals it explains the conceptual mathematical and implementational via matlab programming aspects of time time frequency and synchronization based analyses of magnetoencephalography meg electroencephalography eeg and local field potential lfp recordings from humans and nonhuman animals it is the only book on the topic that covers both the theoretical background and the implementation in language that can be understood by readers without extensive formal training in mathematics including cognitive scientists neuroscientists and psychologists readers who go through the book chapter by chapter and implement the examples in matlab will develop an understanding of why and how analyses are performed how to interpret results what the methodological issues are and how to perform single subject level and group level analyses researchers who are familiar with using automated programs to perform advanced analyses will learn what happens when

they click the analyze now button the book provides sample data and downloadable matlab code each of the 38 chapters covers one analysis topic and these topics progress from simple to advanced most chapters conclude with exercises that further develop the material covered in the chapter many of the methods presented including convolution the fourier transform and euler s formula are fundamental and form the groundwork for other advanced data analysis methods readers who master the methods in the book will be well prepared to learn other approaches

climatology and meteorology have basically been a descriptive science until it became possible to use numerical models but it is crucial to the success of the strategy that the model must be a good representation of the real climate system of the earth models are required to reproduce not only the mean properties of climate but also its variability and the strong spatial relations between climate variability in geographically diverse regions quantitative techniques were developed to explore the climate variability and its relations between different geographical locations methods were borrowed from descriptive statistics where they were developed to analyze variance of related observations variable pairs or to identify unknown relations between variables a guide to empirical orthogonal functions for climate data analysis uses a different approach trying to introduce the reader to a practical application of the methods including data sets from climate simulations and matlab codes for the algorithms all pictures and examples used in the book may be reproduced by using the data sets and the routines available in the book though the main thrust of the book is for climatological examples the treatment is sufficiently general that the discussion is also useful for students and practitioners in other fields supplementary datasets are available via extra springer.com

as the title indicates the theme of this book is the functions of biochromes in animals recent works on zoochromes such as those of d l fox 1953 h m fox and veveris 1960 and vuillaume 1969 have been concerned primarily with the chemical nature and the taxonomic distribution

of these materials and although function has been considered where relevant this has not been the centre of interest and certainly not the basis for the arrangement of the subject matter functional significance is a profitable focus of interest since it is the one theme which can make biochromatology a discrete and integral subject and because it is the main interest in all biological fields at present chromatology seems to be a particularly schizoid subject since it is clear that in metabolic functions biochromes are acting in a chemical capacity whereas integumental pigments function mainly biophysically in neurological and behavioural contexts it is profitable to attempt an integration by studying the functions of as many chromes as possible from all aspects
