although improved treatments have reduced the rates of acute complications from myocardial infarction sequelae such as heart failure and sudden death threaten the future wellbeing of those patients secondary prevention after myocardial infarction is related to cardiovascular risk factors and the effect of the infarct on left ventricular function cardiovascular magnetic resonance imaging cmr is necessary to determine the size of the infarct scar and can with great precision determine left ventricular volumes left ventricular ejection fraction and deformation strain and torsion the purpose of this thesis was to improve on cmr methods to facilitate image acquisition and post processing in patients with high risk of coronary artery disease cad in paper 1 a three dimensional phase sensitive inversion recovery 3d psir sequence was modified to measure t1 during a single breath hold the measured t1 values were used to extrapolate a map of t1 relaxation which avoided the time consuming manual determination of the inversion time the data collection consisted of phantom experiments monte carlo simulations of the effect of various heart rates and clinical investigation of 18 patients with myocardial infarction scar images created with the modified sequence were compared to those created with the standard sequence the 3d psir sequence was able to measure t1 relaxation with a high accuracy up to 800 ms which is in the suitable range for scar imaging simulated arrhythmias showed that the method was robust and able to tolerate some variation in heart rate the modified sequence provides measurements of inversion time that can be used to facilitate standard scar imaging or to reconstruct synthetic scar images images of infarct scar obtained with the 3d psir sequence bore striking similarity to images obtained with the standard sequence in paper 2 125 patients with high risk of cad were investigated using the displacement encoding with stimulated echoes dense sequence image segments with infarct scar area 50 transmural could be identified with a sensitivity of 95 and a specificity of 80 based on circumferential strain calculated from the dense measurements the dense sequence was also applied in other directions but its sensitivity and specificity to detect scar was lower than when used for circumferential strain in paper 3 90 patients with high risk of cad were examined by dense tagging with harmonic phase harp

imaging and cine imaging with feature tracking ft to detect cardiac abnormalities as manifested in end systolic circumferential strain circumferential strain calculated with dense had higher sensitivity and specificity than the competing methods to detect infarction with transmural 50 global circumferential strain measured by dense correlated better with global parameters such as left ventricular ejection fraction myocardial wall mass left ventricular end diastolic and end systolic volume than strain measured by ft or harp in paper 4 myocardial torsion was investigated using dense harp and ft in 48 patients with high risk of cad torsion measured by each of the three methods was correlated with other global measures such as left ventricular ejection fraction left ventricular mass and left ventricular end diastolic and end systolic volumes the torsion measurements obtained with dense had a stronger relationship with left ventricular ejection fraction left ventricular mass and volumes than those obtained with harp or ft dense was superior to the other methods for strain and torsion measurement and can be used to describe myocardial deformation quantitatively and objectively
