this book intends to be an updated compilation of the most important buccal gastric intestinal
pulmonary nasal vaginal ocular skin and blood brain barrier in vitro models for predicting the
permeability of drugs concepts and models for drug permeability studies focuses on different
approaches and comprises of various models each model describes the protocol of seeding
and conservation the application for specific drugs and takes into account the maintenance of
physiologic characteristics and functionality of epithelium from the simplest immortalized cell
based monoculture to the most complex engineered tissue models chapters also discuss the
equivalence between in vitro cell and tissue models and in vivo conditions highlighting how
each model may provisionally resemble a different drug absorption route updated information

regarding the most recent in vitro models to study the permeability of drugs short and concise chapters covering all the biological barriers with interest in drug permeability a combination of bibliographic information related with individual models and footnote instructions of technical procedures for construction of cell and tissue based models simple and clear scientific content adaptable for young scientists and experimented researchers

challenging problems involving jet and plume phenomena are common to many areas of fundamental and applied scientific research and an understanding of plume and jet behaviour is essential in many geophysical and industrial contexts for example in the field of meteorology where pollutant dispersal takes place by means of atmospheric jets and plumes formed either naturally under conditions of convectively driven flow in the atmospheric boundary layer or anthropogenically by the release of pollutants from tall chimneys in other fields of geophysics buoyant plumes and jets are known to play important roles in oceanic mixing processes both at the relatively large scale as in deep water formation by convective sinking and at the relatively small scale as with plume formation beneath ice leads for example in the industrial context the performances of many engineering systems are determined primarily by the behaviour of buoyant plumes and jets for example i in sea outfalls where either sewage or thermal effluents are discharged into marine and or freshwater environments ii in solar ponds where buoyant jets are released under density interfaces iii in buildings where thermally generated plumes affect the air quality and ventilation properties of architectural environments iv in rotating machinery where fluid jet are used for cooling purposes and v in long road and rail tunnels where safety and ventilation procedures rely upon an understanding of the behaviour of buoyant jets in many other engineering and oceanographic contexts the properties of jets and plumes are of great importance
