many years of cumulative research has been conducted on the usage of fiber reinforced composites for biomedical application but no one source exists where this topic is dealt with systematically this book addresses polymer composites applied to bioengineering in a comprehensive manner for potential applications to be successful full advantage must be taken of the materials properties and the manufacturing techniques to meet the needs of biomedical application this book focuses on fiber based composites applied

to bioengineering it addresses three main areas first it presents a comprehensive survey of biocomposites from the existing literature in various medical applications paying particular attention to hard tissue related implants second mechanical designs and manufacturing aspects of various fibrous polymer matrix composites are described the third area concerns examples of the design and development of several medical devices and implants using polymer composites

the economic importance of composite materials is now well known there are strong indications everywhere that this importance will be increasing in the future composite materials now occupy an established position in the aerospace industry they are also used for many components in the automotive industry and civil infrastructures now have their reinforcements made of composite materials there is a large range of manufacturing processes for the production of low cost composites there is a need by engineers working in composites for a practical source of reference for the fundamentals of composites this book fills that need in the educational sector composite materials now are taught at many universities around the world usually the topic covered is laminate theory composites design courses also exist in a few universities and institutes the demand from students and also practitioners of composites for knowledge and training in design and manufacturing of composites is increasing however a good design book has not been available

metal matrix composites constitute a new class of materials now starting to make a major industrial impact in fields as diverse as aerospace automotives and electronics this book gives a comprehensive integrated coverage of these materials including the background to analytical experimental production and application oriented aspects clear pictorial descriptions are given of the basic principles governing various properties and characteristics these encompass mechanical thermal electrical environmental and wear behaviour coverage also extends to material processing and component fabrication aspects and to a survey of commercial usage this book is aimed primarily at scientists engineers production managers and all those involved in research on new materials in general and metal matrix composites in particular but may also be suitable for use as a text in beginning graduate and advanced undergraduate courses

among the modern materials the composites have a few decades of history however there has been a tremendous advancement of this class of material in science and technology during recent decades composite materials have steadily gained ground in nearly all sectors the composite materials have

been used in various industrial applications such as buildings and constructions aerospace automotive and sports equipment consumer products etc nanotechnology is rapidly evolving and science engineering and technology have merged to bring nanoscale materials that much closer to reality it is one of the fastest growing areas for research nanocomposite materials are helping improve products that we use every day and creating new exciting products for the future composites and nanocomposites composed of reinforcements nano reinforcements and matrices are well known engineering materials keeping in mind the advantages of composite and nanocomposite materials this book covers fundamental effects product development properties and applications of the materials including material chemistry designing and manufacturing the book also summarizes the recent developments made in the area of advanced composite and nanocomposite materials a number of critical issues and suggestions for future work are discussed underscoring the roles of researchers for the efficient development of composites and nanocomposites through value additions to enhance their use

introduction to composite materials review of stress strain and material behavior lamina analysis mechanical test methods for lamina failure theories laminate analysis appendix a b c d glossary

today fiber reinforced composites are in use properties of different component fiber in a variety of structures ranging from space matrix filler materials craft and aircraft to buildings and bridges manufacturing techniques this wide use of composites has been facilitated by the introduction of new materials testing improvements in manufacturing processes mechanically fastened and bonded joints and developments of new analytical and test repairing methods unfortunately information on damage tolerance these topics is scattered in journal articles in environmental effects conference and symposium proceedings in and disposal health safety reuse workshop notes and in government and commercial applications in many reports this proliferation of the source aircraft and spacecraft material coupled with the fact that some of land transportation the relevant publications are hard to find or marine environments are restricted makes it difficult to identify and biotechnology obtain the up to date knowledge needed to construction and infrastructure utilize composites to their full advantage sporting goods this book intends to overcome these difficulties each chapter written by a recognized expert contributes by presenting in a single volume is self contained and contains many of the many of the recent advances in the field of state of the art techniques required for practical composite materials the main focus of this technical applications of composites

the idea that materials can be designed to satisfy specific performance requirements is relatively new with high performance composites however the entire process of designing and fabricating a part can be worked out before manufacturing the purpose of this book is to present an integrated approach to the design and manufacturing of products from advanced composites it shows how the basic behavior of composites and their constitutive relationships can be used during the design stage which minimizes the complexity of manufacturing composite parts and reduces the repetitive design build test cycle designing it right the first time is going to determine the competitiveness of a company the reliability of the part the robustness of fabrication processes and ultimately the cost and development time of composite parts most of all it should expand the use of advanced composite parts in fields that use composites only to a limited extent at this time to achieve these goals this book presents the design and fabrication of novel composite parts made for machine tools and other applications like robots and automobiles this book is suitable as a textbook for graduate courses in the design and fabrication of composites it will also be of interest to practicing engineers learning about composites and axiomatic design a cd rom is included in every copy of the book containing axiomatic clpt software this program developed by the authors will assist readers in calculating material properties from the microstructure of the composite this book is part of the oxford series on advanced manufacturing

composite materials volume 2 mechanics of composite materials deals with the prediction of the deformation behavior and strength of composite materials the book discusses the basic concepts in micromechanics definition of effective moduli and the influence of the number of fibers through the thickness within a single composite layer on the effective properties the text also describes the exact moduli of anisotropic laminates the elastic behavior of composites and the viscoelastic behavior and analysis of composite materials the elastoplastic behavior of composites and the application of statistical theories for the determination of thermal electrical and magnetic properties of heterogeneous materials are also considered the book further tackles the finite deformations of ideal fiber reinforced composites wave propagation and vibrations in directionally reinforced composites and the phenomenological anisotropic failure criterion the text also looks into the photoelastic investigation of composites civil engineers mechanical engineers aerospace engineers and people involved in the study of non metallic materials will find the book invaluable
