in the last few years the development of sonographic contrast agents or microbubbles has stimulated increasingly intensive studies on the relationships between ultrasound and contrast media as a result contrast specific hardware and software systems have been introduced by different ultrasound manufacturers with impressive speed this has finally led to the birth of a very new imaging modality contrast enhanced sonography ceus since 1999 the introduction of second generation contrast agents has represented a decisive step towards the extensive clinical use of ceus and has simultaneously made obsolete most if not all scientific publications available so far this book is to our knowledge the first to deal entirely with second generation contrast agents and the most updated contrast specific software for noncardiologic uses the reasons why the liver has been chosen as the only target of the book are easily understandable by radiologists and hepatologists alike the study of vascularity is the only purpose of ceus and the liver has a unique vascular system with two different inflow systems resulting in a single outflow furthermore the pathologically different focal liver lesions flls are mostly characterized by different models of vascularity ceus can mimic contrast

enhanced computed tomography and magnetic resonance imaging basing differential diagnosis on the morphological and temporal characteristics of enhancement but with the additional unique advantage of the study being done in real time

this book provides an up to date overview on the clinical value of contrast agents in ultrasound the volume moves from a background section on technique and methodology to the main sections on the clinical application of contrast ultrasound in the liver and in vascular diseases a final section discusses results and prospects of contrast ultrasound modality in the other fields
