with the advent of multimedia digital signal processing dsp of sound has emerged from the shadow of bandwidth limited speech processing to become a research field of its own to date most research in dsp applied to sound has been concentrated on speech which is bandwidth limited to about 4 kilohertz speech processing is also limited by the low fidelity typically expected in the telephone network today the main applications of audio dsp are high quality audio coding and the digital generation and manipulation of music signals they share common research topics including perceptual measurement techniques and analysis synthesis methods additional important topics are hearing aids using signal processing technology and hardware architectures for digital signal processing of audio in all these areas the last decade has seen a significant amount of application oriented research the frequency range of wideband audio has an upper limit of 20 kilohertz and the

resulting difference in frequency range and signal to noise ratio snr due to sample size must be taken into account when designing dsp algorithms there are whole classes of algorithms that the speech community is not interested in pursuing or using these algorithms and techniques are revealed in this book this book is suitable for advanced level courses and serves as a valuable reference for researchers in the field interested and informed engineers will also find the book useful in their work
