the high temperature solid oxide fuel cell sofc is identified as one of the leading fuel cell technology contenders to capture the energy market in years to come however in order to operate as an efficient energy generating system the sofc requires an appropriate control system which in turn requires a detailed modelling of process dynamics introducing state of the art dynamic modelling estimation and control of sofc systems this book presents original modelling methods and brand new results as developed by the authors with comprehensive coverage and bringing together many aspects of sofc technology it considers dynamic modelling through first principles and data based approaches and considers all aspects of

control including modelling system identification state estimation conventional and advanced control key features discusses both planar and tubular sofc and detailed and simplified dynamic modelling for sofc systematically describes single model and distributed models from cell level to system level provides parameters for all models developed for easy reference and reproducing of the results all theories are illustrated through vivid fuel cell application examples such as state of the art unscented kalman filter model predictive control and system identification techniques to sofc systems the tutorial approach makes it perfect for learning the fundamentals of chemical engineering system identification state estimation and process control it is suitable for graduate students in chemical mechanical power and electrical engineering especially those in process control process systems engineering control systems or fuel cells it will also aid researchers who need a reminder of the basics as well as an overview of current techniques in the dynamic modelling and control of sofc

this unique two volume set presents the subjects of stochastic processes information theory and lie groups in a unified setting thereby building bridges between fields that are rarely studied by the same people unlike the many excellent formal treatments available for each of these subjects individually the emphasis in both of these volumes is on the use of stochastic geometric and group theoretic concepts in the modeling of physical phenomena stochastic models information theory and lie groups will be of interest to advanced undergraduate and graduate students researchers and practitioners working in applied mathematics the physical sciences and engineering extensive exercises motivating examples and real world applications make the work suitable as a textbook for use in courses that emphasize applied stochastic processes or differential geometry

the volume offers an innovative and systematic exploration of the diverse ways in which later greek epic interacts with the latin literary tradition taking as a starting point the premise that it is probable for the greek epic poets of the late antiquity to have been familiar with leading works of latin poetry either in the original or in translation the contributions in this book pursue a new form of intertextuality in which the leading epic poets of the imperial era quintus of smyrna triphiodorus nonnus and the author of the orphic argonautica engage with a range of models in inventive complex and often covert ways instead of asking in other words whether greek authors used latin models we ask how they engaged with them and why they opted for certain choices and not for others through sophisticated discussions it becomes clear that intertexts are usually systems that combine ideology cultural traditions and literary aesthetics in an inextricable fashion the book will prove that latin literature far from being

distinct from the greek epic tradition of the imperial era is an essential indeed defining component within a common literary and ideological heritage across the roman empire
