unlike some other reproductions of classic texts 1 we have not used ocr optical character recognition as this leads to bad quality books with introduced typos 2 in books where there are images such as portraits maps sketches etc we have endeavoured to keep the quality of these images so they represent accurately the original artefact although occasionally there may be certain imperfections with these old texts we feel they deserve to be made available for future generations to enjoy

excerpt from comparative anatomy of vertebrates vertebrate anatomy is everywhere taught by the laboratory method the student studies and dissects representatives of several classes thus gaining an autoptic knowledge of the various organs and their positions in these forms these facts do not constitute a science until they are properly compared and correlated with each other and with the conditions in other animals it is the purpose of the author to present a volume of moderate size which may serve as a framework around which these facts can be grouped so that their bearings may be readily

recognized and a broad conception of vertebrate structure may be obtained in order that this may be realized embryology is made the basis the various structures being traced from the undifferentiated egg into the adult condition this renders it easy to compare the embryonic stages of the higher vertebrates with the adults of the lower and to recognize the resemblances and differences between organs in the separate classes there has been no attempt to describe the structure of any species in detail but rather to outline the general morphology of all vertebrates to aid in the discrimination of the broader features and the more minor details two sizes of type have been used the larger for matter to be mastered by the student the smaller for details and modifications in the separate classes to which reference may need to be made considerable space has been given to the skull as there is no feature of vertebrate anatomy which lends itself more readily to comparative study of the greatest value to the beginning student while the same specimens can be used in the laboratory year after year the skull also has a special interest since nowhere else is there the same chance of tracing modifications in all groups since the first appearance of vertebrates on the earth to aid in this extinct as well as recent species have been included it was the desire of the author to adopt the nomenclature of the german anatomical society bna but this was often found impracticable the bna was based solely upon human anatomy and it fails utterly in many respects when the attempt is made to transfer its terms to other groups about the publisher forgotten books publishes hundreds of thousands of rare and classic books find more at forgottenbooks.com this book is a reproduction of an important historical work forgotten books uses state of the art technology to digitally reconstruct the work preserving the original format whilst repairing imperfections present in the aged copy in rare cases an imperfection in the original such as a blemish or missing page may be replicated in our edition we do however repair the vast majority of imperfections successfully any imperfections that remain are intentionally left to preserve the state of such historical works
