there has been an increasing interest in multi disciplinary research on multisensor
attitude estimation technology driven by its versatility and diverse areas of
application such as sensor networks robotics navigation video biomedicine etc
attitude estimation consists of the determination of rigid bodies orientation in 3d
space this research area is a multilevel multifaceted process handling the
automatic association correlation estimation and combination of data and
information from several sources data fusion for attitude estimation is motivated by
several issues and problems such as data imperfection data multi modality data
dimensionality processing framework etc while many of these problems have been
identified and heavily investigated no single data fusion algorithm is capable of
addressing all the aforementioned challenges the variety of methods in the
literature focus on a subset of these issues to solve which would be determined
based on the application in hand historically the problem of attitude estimation has
been introduced by grace wahba in 1965 within the estimate of satellite attitude
and aerospace applications this book intends to provide the reader with both a
generic and comprehensive view of contemporary data fusion methodologies for
attitude estimation as well as the most recent researches and novel advances on
multisensor attitude estimation task it explores the design of algorithms and
architectures benefits and challenging aspects as well as a broad array of
disciplines including navigation robotics biomedicine motion analysis etc a number
of issues that make data fusion for attitude estimation a challenging task and
which will be discussed through the different chapters of the book are related to 1
the nature of sensors and information sources accelerometer gyroscope
magnetometer gps inclinometer etc 2 the computational ability at the sensors 3 the
theoretical developments and convergence proofs 4 the system architecture
computational resources fusion level

this is an entirely new book the first edition appeared in 1923 and at that time it was up to date but in 1935 and 1938 the author and prof d j struik published a new book their einföhrung i and li and this book not only gave the first systematic introduction to the kernel index method but also contained many notions that had come into prominence since 1923 for instance densities quantities of the second kind pseudo

quantities normal coordinates the symbolism of exterior forms the lie derivative the theory of variation and deformation and the theory of subprojective connexions were included now since 1938 there have been many new developments and so a book on ricci calculus and its applications has to cover quite different ground from the book of 1923 though the purpose remains to make the reader acquainted with ricci's famous instrument in its modern form the book must have quite a different methodical structure and quite different applications have to be chosen the first chapter contains algebraical preliminaries but the whole text is modernized and there is a section on hybrid quantities quantities with indices of the first and of the second kind and one on the many abridged notations that have been developed by several authors in the second chapter the most important analytical notions that come before the introduction of a connexion are dealt with in full
