nowadays the advent of the wireless internet and the rapid expanding of novel technologies on the

mass market have represented a tremendous stimulus for pushing the development of interactive systems able to encompass support for a larger and larger variety of users tasks devices and contexts in this thesis we present the benefits of using task models in the various steps of the lifecycle of an interactive application indeed we show how they can play an important role in the requirements elicitation phase for example by requiring precise definition of temporal relationships between the different activities that should be performed so avoiding any ambiguities furthermore we describe how task models may be exploited in software development beyond early analysis as they can provide valuable information for the design of interactive applications through a number of criteria specifying how to use the data contained in task models to drive the design of the user interface additionally we analyse how they can be used for verification purposes in order to check some properties of the modelled system in combination with other models so improving the level of confidence towards the system which can be relevant especially in safety critical contexts lastly we show the benefits that can be gained from using task models in the usability evaluation phase through a systematic analysis of the impact that the deviations from an expected task plan could have on the quality of the overall system

bridges the gaps between regulatory engineering and science disciplines in order to comprehensively cover pollutant fate and transport in environmental multimedia this book presents and integrates all aspects of fate and transport chemistry modeling various forms of assessment and the environmental legal framework it approaches each of these topics initially from a conceptual perspective before explaining the concepts in terms of the math necessary to model the problem so that students of all levels can learn and eventually contribute to the advancement of water quality science the first third of pollutant fate and transport in environmental multimedia is dedicated to the relevant aspects of chemistry behind the fate and transport processes it provides relatively simple examples and problems to teach these principles the second third of the book is based on the conceptual derivation and the use of common models to evaluate the importance of model parameters and sensitivity analysis complex equation derivations are given in appendices computer exercises and available simulators teach and enforce the concepts and logic behind fate and transport modeling the last third of the book is focused on various aspects of assessment toxicology risk benefit cost and
