traumatic injury of the spinal cord affects the entire organism directly and indirectly primary injury destroys neurons and severs axons which participate in neural circuits secondary injuries and pathologies arise from numerous sources including systemic inflammation consequential damage of cutaneous muscular and visceral tissues and dysregulation of autonomic endocrine and sensory motor functions evidence is mounting that spinal cord injury sci affects regions of the nervous system spatially remote from the injury site as well as peripheral tissues and alters some basic characteristics of primary afferent cell biology and physiology cell number size frequency electrophysiology other the degree of afferent input and processing above the lesion is generally intact while that in the peri lesion area is highly variable though pathologies emerge in both regions including a variety of pain syndromes primary afferent input to spinal regions

below the injury and the processing of this information becomes even more important in the face of complete or partial loss of descending input because such spared sensory processing can lead to both adaptive and pathological outcomes this issue hosts review and research articles considering mechanisms of plasticity of primary afferent neurons and sensory processing after sci and how such plasticity contributes to sparing and or recovery of functions as well as exacerbation of existing and or emergent pathologies a critical issue for the majority of the sci community is chronic above peri and below level neuropathic pain much of which may arise at least in part from plasticity of afferent fibers and nociceptive circuitry for example autonomic dysreflexia is common hypertensive syndrome that often develops after sci that is highly reliant on maladaptive nociceptive sensory input and processing below the lesion moreover the loss of descending input leaves the reflexive components of bladder bowel sexual function uncoordinated and susceptible to a variety of effects through afferent fiber plasticity finally proper afferent feedback is vital for the effectiveness of activity dependent rehabilitative therapies but aberrant nociceptive input may interfere with these approaches since they are often unchecked due to loss of descending modulation
