this book had its nucleus in some lectures given by one of us j o m b in a course on electrochemistry to students of energy conversion at the university of pennsyl nia it was there that he met a number of people trained in chemistry physics biology metallurgy and materials science all of whom wanted to know something about electrochemistry the concept of writing a book about electrochemistry which could be understood by people with very varied backgrounds was thereby engendered the lectures were recorded and written up by dr klaus muller as a 293 page manuscript at a later stage a k n r joined the effort it was decided to make a fresh start and to write a much more comprehensive text of methods for direct energy conversion the electrochemical one is the most advanced and seems the most likely to become of considerable practical importance thus conversion to electrochemically powered transportation systems appears to be an important step by means of which the difficulties of air pollution and the effects of an increasing concentration in the atmosphere of carbon dioxide may be met cor sion is recognized as having an electrochemical basis the synthesis of nylon now contains an important electrochemical stage some central biological mechanisms have been shown to take place by means of electrochemical reactions a number of american organizations have recently recommended greatly increased activity in training and research in electrochemistry at universities in the united states

this book consists of a number of papers regarding the thermodynamics and structure of multicomponent systems that we have published during the last decade even though they involve different topics and different systems they have something in common which can be considered as the signature of the present book first these papers are concerned with difficult or very nonideal systems i e systems with very strong interactions e g hyd gen bonding between components or systems with large differences in the partial molar v olumes of the components e g the aqueous solutions of proteins or systems that are far from normal conditions e g critical or near critical mixtures second the conventional thermodynamic methods are not sufficient for the accurate treatment of these mixtures last but not least these systems are of interest for the pharmaceutical biomedical and related industries in order to meet the thermodynamic challenges involved in these complex mixtures we employed a variety of traditional methods but also new methods such as the fluctuation theory of kirkwood and buff and ab initio quantum mechanical techniques the kirkwood buff kb theory is a rigorous formalism which is free of any of the approximations usually used in the thermodynamic treatment of multicomponent systems this theory appears to be very fruitful when applied to the above mentioned difficult systems
