stepping back from the above analysis it is helpful to ask whether the shift to a more individualistic conception of persons carries traction for those who do not share its religious underpinnings judeo christian personhood was grounded on the idea that all and only human beings are made in the image of god imago dei for contemporary secular philosophers there seems to be no corollary justification for claiming that all and only human beings qualify as persons some contemporary christians such as noonan have sought to defend an exclusive moral status for human beings by arguing that possessing the human genetic code affords the secular underpinnings for such a position yet this proposal was eventually rebuffed as speciesist speciesism a term coined in the 1970s by ryder and popularized by singer is the position that assigning moral standing on the basis of species membership is morally arbitrary

in this work the author lets be an irreducible root system with coxeter group he considers subsets of which are abelian meaning that no two roots in the set have sum in he classifies all maximal abelian sets i.e. abelian sets properly contained in no other up to the action of for each orbit of maximal abelian sets we provide an explicit representative identify the setwise stabilizer of in and decompose into orbits abelian sets of roots are closely related to abelian unipotent subgroups of simple algebraic groups and thus to abelian subgroups of finite groups of lie type over fields of characteristic parts of the work presented here have been used to confirm the rank of and somewhat unexpectedly to obtain for the first time the ranks of the monster and baby monster sporadic groups together with the double cover of the latter root systems of classical type are dealt with quickly here the vast majority of the present work concerns those of exceptional type in these root systems the author introduces the notion of a radical set such a set corresponds to a subgroup of a simple algebraic group lying in the unipotent radical of a certain maximal parabolic subgroup the classification of radical maximal abelian sets for the larger root systems of exceptional type presents an interesting challenge it is

accomplished by converting the problem to that of classifying certain graphs modulo a particular equivalence relation

the emergent mathematical philosophy of categorification is reshaping our view of modern mathematics by uncovering a hidden layer of structure in mathematics revealing richer and more robust structures capable of describing more complex phenomena categorified representation theory or higher representation theory aims to understand a new level of structure present in representation theory rather than studying actions of algebras on vector spaces where algebra elements act by linear endomorphisms of the vector space higher representation theory describes the structure present when algebras act on categories with algebra elements acting by functors the new level of structure in higher representation theory arises by studying the natural transformations between functors this enhanced perspective brings into play a powerful new set of tools that deepens our understanding of traditional representation theory this volume exhibits some of the current trends in higher representation theory and the diverse techniques that are being employed in this field with the aim of showcasing the many applications of higher representation theory the companion volume contemporary mathematics volume 684 is devoted to categorification in geometry topology and physics

nonlinear algebra provides modern mathematical tools to address challenges arising in the sciences and engineering it is useful everywhere where polynomials appear in particular data and computational sciences statistics physics optimization the book offers an invitation to this broad and fast developing area it is not an extensive encyclopedia of known results but rather a first introduction to the subject allowing the reader to enter into more advanced topics it was designed as the next step after linear algebra and well before abstract algebraic geometry the book presents both classical topics like the nullstellensatz and primary decomposition and more modern ones like tropical geometry and semidefinite programming the focus lies on interactions and applications each of the thirteen chapters introduces fundamental concepts the book may be used for a one semester course and the over 200 exercises will help the readers to deepen their understanding of the subject

what are the aims of sociology what are its objects of study how relevant is the classical tradition to the practice of sociology today this volume brings together internationally renowned and new scholars to consider the changing relationship between contemporary and classical sociology arguing that recent historical and theoretical developments make reconsideration timely it suggests that whilst the classical tradition has a continuing pertinence it is inevitably subject to ongoing reconfiguration assessing the explanatory value of classical and contemporary forms of sociology interrogating social theory as both a form of explanation and a mode of practice and considering the possible consequences for the discipline of questions about its subject matter sociological objects steers a course between assertions about radical epistemological breaks on the one hand and reverence for the classical tradition on the other rather it emphasizes the value of reworking reconsidering and reconfiguring sociological thought
