in writing this book our goal was to produce a text suitable for a first course in mathematical logic more attuned than the traditional textbooks to the recent dramatic growth in the applications of logic to computer science thus our choice of topics has been heavily influenced by such applications of course we cover the basic traditional topics syntax semantics soundness

completeness and compactness as well as a few more advanced results such as the theorems of skolem lowenheim and herbrand much of our book however deals with other less traditional topics resolution theorem proving plays a major role in our treatment of logic especially in its application to logic programming and prolog we deal extensively with the mathematical foundations of all three of these subjects in addition we include two chapters on nonclassical logic modal and intuitionistic that are becoming increasingly important in computer science we develop the basic material on the syntax and semantics via kripke frames for each of these logics in both cases our approach to formal proofs soundness and completeness uses modifications of the same tableau method introduced for classical logic we indicate how it can easily be adapted to various other special types of modal logics a number of more advanced topics including nonmonotonic logic are also briefly introduced both in the nonclassical logic chapters and in the material on logic programming and prolog

what sets this book apart from others on logic programming is the breadth of its coverage the authors have achieved a fine balance between a clear and authoritative treatment of the theory and a practical problem solving approach to its applications this edition introduces major new developments in a continually evolving field and includes such topics as concurrency and equational and constraint logic programming
