the goal of this third edition of nonlinear dynamics and chaos with applications to physics biology chemistry and engineering is the same as previous editions to provide a good foundation and a joyful experience for anyone who d like to learn about nonlinear dynamics and chaos from an applied perspective the presentation stresses analytical methods concrete examples and geometric intuition the theory is developed systematically starting with first order differential equations and their bifurcations followed by phase plane analysis limit cycles and their bifurcations and culminating with the lorenz equations chaos iterated

maps period doubling renormalization fractals and strange attractors the prerequisites are comfort with multivariable calculus and linear algebra as well as a first course in physics ideas from probability complex analysis and fourier analysis are invoked but they re either worked out from scratch or can be safely skipped or accepted on faith changes to this edition include substantial exercises about conceptual models of climate change an updated treatment of the sir model of epidemics and amendments based on recent research about the selkov model of oscillatory glycolysis equations diagrams and every word has been reconsidered and often revised there are also about 50 new references many of them from the recent literature the most notable change is a new chapter chapter 13 is about the kuramoto model the kuramoto model is an icon of nonlinear dynamics introduced in 1975 by the japanese physicist yoshiki kuramoto his elegant model is one of the rare examples of a high dimensional nonlinear system that can be solved by elementary means students and teachers have embraced the book in the past its general approach and framework continue to be sound
