the context of parallel processing the field of digital computer architecture has grown explosively in the past two decades through a steady stream of experimental research tool building efforts and theoretical studies the design of an instruction set architecture once considered an art has been transformed into one of the most quantitative branches of computer technology at the same time better understanding of various forms of concurrency from standard pipelining to massive parallelism and invention of architectural structures to support a reasonably efficient and user friendly programming model for such systems has allowed hardware performance to continue its exponential growth this trend is expected to continue in the near future this explosive growth linked with the expectation that performance will continue its exponential rise with each new generation of hardware and that in stark contrast to software computer hardware will function correctly as soon as it comes off the assembly line has its down side it has led to unprecedented hardware complexity and almost intolerable development costs the challenge facing current and future computer designers is to institute simplicity where we now have complexity to use fundamental theories being developed in this area to gain performance and ease of use benefits from simpler circuits to understand the interplay between technological capabilities and limitations on the one hand and design decisions based on user and application requirements on the other
