this book presents the state of the art in designing high performance algorithms that

combine simulation and optimization in order to solve complex optimization problems in science and industry problems that involve time consuming simulations and expensive multi objective function evaluations as traditional optimization approaches are not applicable per se combinations of computational intelligence machine learning and high performance computing methods are popular solutions but finding a suitable method is a challenging task because numerous approaches have been proposed in this highly dynamic field of research that's where this book comes in it covers both theory and practice drawing on the real world insights gained by the contributing authors all of whom are leading researchers given its scope it offers a comprehensive reference guide for researchers practitioners and advanced level students interested in using computational intelligence and machine learning to solve expensive optimization problems

a natural hierarchy exists in pharmacokinetic pharmacodynamic modeling culminating in population pharmacokinetic models which are a specific type of nonlinear mixed effects model the purpose of this book is to present through theory and example how to develop pharmacokinetic models both at an individual and population level in order to do so however one must first understand linear models and then build to nonlinear models followed by linear mixed effects models and then ultimately nonlinear mixed effects models this book develops in that manner each chapter builds upon previous chapters by first presenting the theory and then illustrating the theory using published data sets and actual data sets that were used in the development of new chemical entities collected by the author during his years in industry a key feature of the book is the process of modeling most books and manuscripts often present the final model never showing how the model evolved in this book all examples are presented in an evolutionary manner

the proceedings contain contributions presented by authors from more than 30 countries at eurodyn 2002 the proceedings show recent scientific developments as well as practical applications they cover the fields of theory of vibrations nonlinear vibrations stochastic dynamics vibrations of structured elements wave propagation and structure borne sound including questions of fatigue and damping emphasis is laid on vibrations of bridges buildings railway structures as well as on the fields of wind and earthquake engineering respectively enriched by a number of keynote lectures and organized sessions the two volumes of the proceedings present an overview of the state of the art of the whole field of structural dynamics and the tendencies of its further development
