free radicals are atoms or molecules containing unpaired electrons damage occurs when the free radical encounters another molecule and seeks to find another electron to pair its unpaired electron free radicals can cause mutation in different biological compounds such as protein nucleic acids and lipids and the damage caused by the free radicals lead to various diseases cancer cardiovascular disease aging etc antioxidants are helpful in reducing and preventing damage from free radical reactions because of their ability to donate electrons which neutralize the radical without forming another ascorbic acid for example can lose an electron to a free radical and remain stable itself by passing its unstable electron around the antioxidant molecule unfortunately new data indicate that the synthetic antioxidants used in the industry could have carcinogenic effects on human cells thus fueling an intense search for new natural and efficient antioxidants therefore the current book discusses the role and source of antioxidant compounds in nutrition and diets also the current book includes nine chapters contributed by experts around the world and the chapters are categorized into two sections antioxidant compounds and biological activities and natural antioxidants and applications
