some implications of the perceptgenetic studies we should be most grateful to professor gudmund smith for this compilation of studies on perceptgenesis pg smith and his colleagues at lund university

are part of a small insurgency in psychology that has worked gamely and in relative obscurity to document the presence of subjective phases in the process leading to a perceptual object and the infrastructure of this process in the person ality smith describes ingenious methods to probe this hidden undersurface and of a perceptual object is in the ordinary demonstrate that the experiential content an object sense pre perceptual that is the feeling meaning and recognition of are not attached to things out there in the world after they are perceived but are phases ingredient in the process through which the perception occurs to most psychologists this statement would appear so radical as to be hardly worth refuting a subjective approach to perception undermines the realism consensual validation and objectivity of a descriptive science of the mind it is much simpler to interpret the psychic contribution to object perception as an addition to physical nature however the idea that objects are assemblies of sensory bits linked to feeling and meaning associated to memories for recognition and interpretation and then projected back into the world where we see them though at first blush appealing to common sense is so implausible that one is mystified by its universal acceptance

since the late 1800s psychologists have been interested in discerning the strategies subjects employ to solve psychological tests piaget 1928 werner 1940 gesell 1941 much of this work however has relied on qualitative observations in the 1970s edith kaplan adopted this approach to the analysis of standardized neuropsychological measures unlike her predecessors dr kaplan and her colleagues emphasized the application of modern behavioral neurology to the analysis of the test data her approach was later termed the boston process approach to neuropsychological assessment while edith kaplan s work generates a great deal of enthusiasm the qualitative nature of her analyses did not allow for its adoption by mainstream neuropsychologists however in recent years this limitation has begun to be addressed clinicians and researchers have developed new methodologies for quantifying the boston process approach leading to the emergence of a new field which is collectively termed the quantified process approach quantified process approach to neuropsychological assessment outlines the rationale for the emergence of this new approach and reviews the state of the art research literature and up to date clinical applications as they pertain to the evaluation of neuropsychiatric head injured and learning disabled patients when available norms and scoring forms are included in the appendices

the boston process approach to neuropsychological assessment advanced by edith kaplan has a long and well respected history in the field however its theoretical and empirical support has not previously been assembled in an easily accessible format this volume fills that void by compiling the historical empirical and practical teachings of the process approach the reader will find a detailed history of the precursors to this model of thought its development through its proponents such as harold goodglass nelson butters laird cermak and norman geschwind and its continuing legacy the second section provides a guide to applying the boston process approach to some of the field s most commonly used measures such as the various wechsler intelligence scales the trail making test the california verbal learning test and the boston naming test here the reader will find a detailed history of the empirical evidence for test administration and interpretation using boston process approach tenets the final section of the book provides various perspectives on the implementation of the boston process approach in various clinical and research settings and with specialized populations

psychological science constructs much of the knowledge that we consume in our everyday lives this book is a systematic analysis of this process and of the nature of the knowledge it produces the authors show how mainstream scientific activity treats psychological properties as being fundamentally stable universal and isolable they then challenge this status quo by inviting readers to recognize that dynamics context specificity interconnectedness and uncertainty are a natural and exciting part of

human psychology these are not things to be avoided and feared but instead embraced this requires a shift toward a process based approach that recognizes the situated time dependent and fundamentally processual nature of psychological phenomena with complex dynamic systems as a framework this book sketches out how we might move toward a process based praxis that is more suitable and effective for understanding human functioning
