analog integrated circuits are very important as interfaces between the digital parts of integrated electronic systems and the outside world a large portion of the effort involved in designing these circuits is spent in the layout phase whereas the physical design of digital circuits is automated to a large extent the layout of analog circuits is still a manual time consuming and error prone task this is mainly due to the continuous nature of analog signals which causes analog circuit performance to be very sensitive to layout parasitics the parasitic elements associated with interconnect wires cause loading and coupling effects that degrade the frequency behaviour and the noise performance of analog circuits device mismatch and thermal effects put a fundamental limit on the achievable accuracy of circuits for successful automation of analog layout advanced place and route tools that can handle these critical parasitics are required in the past automatic analog layout tools tried to optimize the layout without quantifying the performance degradation introduced by layout parasitics therefore it was not guaranteed that the resulting layout met the specifications and one or more layout iterations could be needed in analog layout generation for performance and manufacturability the authors propose a performance driven layout strategy to overcome this problem in this methodology the layout tools are driven by performance constraints such that the final layout with parasitic effects still satisfies

the specifications of the circuit the performance degradation associated with an intermediate layout solution is evaluated at runtime using predetermined sensitivities in contrast with other performance driven layout methodologies the tools proposed in this book operate directly on the performance constraints without an intermediate parasitic constraint generation step this approach makes a complete and sensible trade off between the different layout alternatives possible at runtime and therefore eliminates the possible feedback route between constraint derivation placement and layout extraction besides its influence on the performance layout also has a profound impact on the yield and testability of an analog circuit in analog layout generation for performance and manufacturability the authors outline a new criterion to quantify the detectability of a fault and combine this with a yield model to evaluate the testability of an integrated circuit layout they then integrate this technique with their performance driven routing algorithm to produce layouts that have optimal manufacturability while still meeting their performance specifications analog layout generation for performance and manufacturability will be of interest to analog engineers researchers and students

the development of computational models of design founded on the artificial intelligence paradigm has provided an impetus for much of current design research as artificial intelligence has matured and developed new approaches so the impact of these new approaches on design research has been felt this can be seen in the way concepts from cognitive science has found their way into artificial intelligence and hence into design research and also in the way in which agent based systems are being incorporated into design systems in design research there is an increasing blurring between notions drawn from artificial intelligence and those drawn from cognitive science whereas a number of years ago the focus was largely on applying artificial intelligence to designing as an activity thus treating designing as a form of problem solving today we are seeing a much wider variety of conceptions of the role of artificial intelligence in helping to model and comprehend designing as a process thus we see papers in this volume which have as their focus the development or implementation of frameworks for artificial intelligence in design attempting to determine a unique locus for these ideas we see papers which attempt to find foundations for the development of tools based on the artificial intelligence paradigm often the foundations come from cognitive studies of human designers
