alleviating human suffering

first published in 1986 this volume presents a selection of advances in the field of behaviour science in psychology it can be used as a pick up guide with chapters arranged into three kinds of advances theoretical or philosophical empirical and methodological the preface includes a summary of each of the chapters which range from the role of theory in the behaviour analysis of private events to the use of residential laboratories with programmed environments for the study of behaviours

trust is a central pillar of the scientific enterprise much work in the philosophy of science can be seen as coping with the problem of establishing trust in a certain theory a certain model or even science as a whole however trust in science is threatened by various developments with the advent of more complex models and the increasing usage of computer methods such as machine learning and computer simulation it seems increasingly challenging to establish trust in science how and on what basis can an appropriate trust in science be built we are interested in how trust is established in such cases of increasing complexity of models and communication and what could be appropriate measures to alleviate doubt

we humans are faced with an interesting problem that which we think we understand the most our own behavior we probably understand the least on the eve of a new millennium the planet is beset by a host of problems that are for the most part caused by human behavior ironically although it seems that the greatest impact of our behavior is on the planet and its other inhabitants we may actually be threatening our own future the most for example we have caused untold harm to the air we breathe to the water we drink and by extension to much of the food we eat more important perhaps we have created a society in which among other things many people are anxious and depressed young women starve themselves and alcohol and cigarette use are responsible for hundreds of thousands of cases of illness and death every year and humans still murder one another at an astounding rate while at the same time continuing to affirm the value of human life at a time when it is critical that our children become educated more and more children are not learning the basic skills they will need to think logically so that they can begin to solve the world's problems the question may be not can the planet survive but rather can we humans survive and change our own destructive actions although many scholars philosophers

the scientific enterprise that produces the knowledge we rely on for everything from medical treatments to environmental policies operates through a complex system of institutions incentives and human relationships that profoundly shape what research gets conducted how it gets interpreted and what findings reach public attention understanding how science actually works requires looking beyond the idealized vision of objective researchers pursuing truth through rigorous methodology to examine the economic political and social forces that influence every stage of the research process the funding mechanisms that support scientific research create powerful constraints on what questions can be investigated and what answers are likely to emerge government agencies private foundations and corporate sponsors all have specific priorities political considerations and practical limitations that influence their funding decisions researchers must frame their proposals in ways that appeal to funders interests which can shape research questions toward commercially viable applications politically acceptable conclusions or methodologically convenient approaches rather than the most scientifically important or socially beneficial investigations the institutional structures within which research occurs create additional pressures that can influence scientific outcomes universities depend on research grants for revenue and prestige creating incentives for faculty to pursue funding

rather than necessarily pursuing the most important scientific questions academic departments compete for resources and recognition which can influence hiring decisions promotion criteria and research priorities in ways that may not align with optimal scientific progress the publish or perish culture of academic research creates pressure to generate publishable results on predictable timelines which can discourage long term investigations or research programs that might not yield clear results
