this book traces the development of formal logic from its origins in ancient greece to the present day the authors first discuss the work of logicians from aristotle to frege showing how they were influenced by the philosophical or mathematical ideas of their time they then

examine developments in the present century

The tenth anniversary of the LOPSTR symposium provided the incentive for this volume. LOPSTR started in 1991 as a workshop on logic program synthesis and transformation but later it broadened its scope to logic based program development in general that is program development in computational logic and hence the title of this volume. The motivating force behind LOPSTR has been the belief that declarative paradigms such as logic programming are better suited to program development tasks than traditional non declarative ones such as the imperative paradigm. Specification, synthesis, transformation or specialization, analysis, debugging and verification can all be given logical foundations thus providing a unifying framework for the whole development process. In the past 10 years or so such a theoretical framework has indeed begun to emerge even tools have been implemented for analysis, verification and specialization. However it is fair to say that so far the focus has largely been on programming in the small so the future challenge is to apply or extend these techniques to programming in the large in order to tackle software engineering in the real world. Returning to this volume our aim is to present a collection of papers that reflect significant research efforts over the past 10 years. These papers cover the whole development process: specification, synthesis, analysis, transformation and specialization as well as semantics and systems.

A short history of logic by Egbert Adamson originally published in 1911. The article on logic which Professor Adamson contributed to the ninth edition of the Encyclopaedia Britannica consists of a critical survey of the history of logical theory. Its value is well known to philosophical students and no apology is needed to justify its publication in separate form. It may be mentioned however that this publication was thought to be important at the present time as the work was in danger of becoming less easily accessible owing to the issue of the eleventh edition of the Encyclopaedia in which it is not reprinted. The manuscript of the article has been fortunately preserved alone among the manuscripts of the authors' published writings. It is much fuller than the printed article a number of passages some fifty in all having been struck out by the editor with a view to economy of space. These passages affect both text and notes they vary in length from a few words to whole sections they vary also in importance but the authors own opinion was that the value of his six page preface work had suffered by their omission and with this opinion I agree. In the present book these passages have been restored to their place so that the article as it left the authors hands is now for the first time placed before the reader. The manuscript bears no trace of the editorial blue pencil and the original proof no longer exists so that a doubt may arise as to whether any particular omission may not have been made by the author himself when he corrected the proofs but it is clear from a comparison of manuscript and print that his proof corrections were few and unimportant. No real difficulty therefore has arisen in deciding upon the restorations. The authors style was so concise that greater brevity could not be attained without sacrifice of the matter. It should be borne in mind that the article on logic was written and published in 1882. The

supplementary articles by which it is followed in this volume are all contributions to the history of logic but the first of these that on category also reprinted from the encyclopaedia britannica dates from six years earlier and only the last carries the story on towards a more recent development of logical theory readers of the authors works do not need to be reminded that his own point of view underwent modification and that there are some things here which he might have expressed differently had he revised the work himself with the authors manuscript and printed copy before me my own work as editor has consisted chiefly in selecting the material and seeing it through the press some omitted references have been supplied a few slips of the pen or the press formerly overlooked have been corrected unwieldy paragraphs have been broken up and the punctuation has been simplified but nothing new has been added to text or notes i am responsible for the choice of a title it remains for me to express my grateful thanks to the syndics of the cambridge university press for allowing the publication of the articles on logic and on category in the present form for permission to reprint the critical notices from mind with which the volume ends i am indebted to the kindness of professor davidson of aberdeen literary executor of the late professor bain w e soeley kings college cambridge october 1911

this book is about where to go and what to do in china's reform. its comprehensive overview and economic analysis of china's reform offers a coverage not found in other english language text. it provides an overview of china's development and reform practice, an economic analysis of china's market-oriented reform, and a brief introduction to the theoretical origin, practices, and defects of the planned economy. in so doing, this book demonstrates that the key to the success of china's reform lies in drawing reasonable governance boundaries between government and the market and between government and society. it further discusses the basic elements required for modernizing china's state governance system and conducts an analysis of china's reform and development in 13 key fields. the analysis is based on three dimensions: theoretical logic, practical knowledge, and a historical perspective. this book proposes three elements of comprehensive state governance: inclusive economic institutions, the state capacity to plan and implement policies and laws, and an inclusive and transparent civil society with democracy, the rule of law, fairness, and justice. its analysis also features the novel application of mechanism design theory by employing the two core ideas of information and incentives, and a new research methodology consisting of three dimensions and six natures. this book reviews and grasps china's reform through a qualitative analysis of economic theories and an empirical analysis of statistics from a historical perspective spanning over 180 years. it is proposed to be an important reference for understanding the past, present, and future of china's reform and teaching about the potential economic superpower. it can also serve as an essential resource for those who are interested in china's economic reform and development.

originally published in 1962, a clear and simple account of the growth and structure of mathematical logic, no earlier knowledge of logic being required. after outlining the four lines of thought that have been its roots: the logic of aristotle, the idea of all the parts of mathematics as systems to be designed on the same sort of plan as that used by euclid and his *elements*, and the discoveries in algebra and geometry in 1800-1860, the book goes on to give some of the main ideas and theories of the chief writers on mathematical logic: de morgan, boole, jevons, pierce, frege, peano, whitehead, russell, post, hilbert, and goebel. written to assist readers who require a general picture of current logic, it will also be a guide for those who will later be
