how is one to understand the nature of intelligence one approach is through psychometric testing but such an approach often puts the cart before the horse the test before the theory another approach is to use evolutionary theory this criterion has been suggested by a number of individuals in the past from charles darwin in the more distant past to howard gardner stephen Gould steven pinker carl sagan david stenhouse and many others the chapters in this book address three major questions 1 does evolutionary theory help us understand the nature of human intelligence 2 if so what does it tell us about the nature of human intelligence 3 and if so how has intelligence evolved the goal of this book is to present diverse points of view on the evolution of intelligence as offered by leading experts in the field in particular it may be possible to better understand the nature and societal implications of intelligence by understanding how and why it has evolved as it has this book is unique in offering a diversity of points of view on the topic of the evolution of human intelligence

the scientific understanding of arthropod phylogeny and evolution has changed significantly in recent decades one of the most momentous alterations involved crustaceans which are not a monophyletic group but are part of a larger group along with insects pancrustacea the old ideas surrounding crustacean evolution have served scientists well for many years it is now time to turn toward new research by embracing the results derived from investigations conducted largely within this century for example new definitions have arisen from sources across several fields of study and frederick r schram and stefan koenemann have created a book that explores paleobiodiversity and the diversity of modern body plans developments within ontogenetic studies continue to generate remarkable insights into crustaceomorph evolution in regard to patterns of embryology and a revolution in the application of development genetics phylogeny techniques of analysis and new sources of data derived from molecular sequencing and genetic studies have forced scientists to consider new hypotheses concerning the interrelationships of all the pancrustaceans both the crustaceomorphs and hexapoda yet some fossil groups still remain enigmatic thylacocephala despite this research into fossils even if incompletely understood fills in gaps

of our knowledge of paleobiodiversity and it's useful for many things including analyzing the origin and early evolution of hexapoda evolution and phylogeny of pancrustacea demonstrates the use of multiple alternative hypotheses and other techniques through the well executed presentation of diverse data sources involving pancrustacea readers are left with clues to great mysteries including the possible pathways of evolution within marine arthropods

darwin 1871 and many african folk legends before him proposed a simple but powerful explanation for the large and elongated shape long necks allowed giraffe to outreach presumed competitors particularly during dry season bottlenecks when leaves become scarce simmons and scheepers however this old african folk legend which is still commonly taught in high schools fails to explain among other things the size differences between males and females giraffe cows are up to 1.5 meters shorter than the giraffe bulls not to mention the offspring the wide migration range of the giraffe and the low heights of the most common plants in their diet likewise argue against the dominant selection hypothesis also 1 the fossil links which according to the theory should appear successively and replace each other usually exist simultaneously for long periods of time 2 evolutionary derivations based on similarities rely on circular reasoning 3 the giraffe has eight cervical vertebrae although the 8th vertebra displays almost all the characteristics of a neck vertebra as an exception to the rule the first rib pair is attached there 4 the origin of the long necked giraffe by a macromutation is due to the many synorganized structures extremely improbable 5 sexual selection also lacks a mutational basis and what is more is frequently in conflict with natural selection head clubbing is probably a consequence of a long neck and not a cause see also mitchell et al 2009 6 in contrast to the thus far proposed naturalistic hypotheses the intelligent design theory is basically testable 7 the long necked giraffes possibly all belong to the same basic type inasmuch as 8 a gradual evolution from the short necked to the long necked giraffe is ruled out by the duplication of a neck vertebra and the loss of a thoracic vertebra 9 chance mutations are principally not sufficient to explain the origin of the long necked giraffe 10 the intelligent design theory offers an adequate and satisfying solution to the problems and points to numerous old and new research projects 11 mitchell and skinner present a good analysis of the selectionist problem however their phylogenetic hypotheses presuppose the correctness of the synthetic evolutionary theory and their claims of
