a fundamental problem in neuroscience is the elucidation of the cellular and molecular mechanisms underlying the development and function of the nervous system the complexity of organization the heterogeneity of cell types and their interactions and the difficulty of controlling experimental variables in intact organisms make this a formidable task because of the ability that it affords to analyze smaller components of the nervous system even single cells in some cases and to better control experimental variables cell culture has become an increasingly valuable tool for neuroscientists many aspects of neural development such as proliferation differentiation synaptogenesis and myelination occur in culture with time courses remarkably similar to those in vivo thus in vitro methods often provide excellent model systems for investigating neurobiological questions ross harrison described the first culture of neural tissue in 1907 and used morphological methods to analyze the cultures since that time the technique has been progressively modified and used to address an ever widening range of developmental questions in recent years a convergence of new or improved cell culture biochemical electrophysiological and immunological methods has occurred and been brought to bear on neurobiological questions this volume is intended not to be comprehensive but rather to highlight some of the latest findings with a review of previous important work as well in which combinations of these

methods are used

this is a remarkable time to study the vertebrate retina either as a model for the brain or to understand the first steps in vision we have known about the diversity of retinal neurons and glia for more than one hundred years and we are now extending these findings and making new discoveries about retinal cell types by analyzing gene expression in single cells we have made significant progress toward our ultimate goals of describing the neural circuits in the retinas at the level of connections between identified populations of neurons and understanding neuronal and glial cell function at the molecular level we have also made great strides toward understanding retinal development and the etiology of retinal diseases physiologists are now using more realistic stimuli and modern analytical methods to analyze the mechanisms underlying light responses of retinal neurons and this has led to more accurate computational models of neural circuits in the retina my colleague at the mcgovern medical school in houston steve massey has made many important contributions to this field both as a researcher and as a mentor and he is planning his retirement judith ogilvie christophe ribelayga chai an mao and i will dedicate this issue to him and plan to publish some of his latest work this research topic will include mini reviews and brief communications about neurons and neural circuits in vertebrate retinas the scope will be very broad including anatomical physiological psychophysical and computational approaches to this topic potential topics include but are not restricted to development morphology and synaptic connections of neuronal types light responses spontaneous activity and membrane properties of retinal neurons gene expression and other aspects of cell biology of identified retinal neurons release of neurotransmitters and modulators and their effects in the retina structure and function of electrical synapses in the retina neural circuits that mediate responses to color contrast and movement roles of neuroglia in retinal development homeostasis and light responses contributions of neural circuits in the retina to visual perception evolution of neuronal types and neural circuits in the retina novel techniques for analyzing retinal neurons and neural circuits non invasive methods to analyze retinal structure and function etiology of retinal diseases and potential new therapies directions for future research on the vertebrate retina

with the advent of high temperature superconductivity and the increasing reliability of fabrication techniques superconductor technology has moved firmly into the

mainstream of academic and industrial research there is currently no single source of practical information giving guidance on which technique to use for any particular category of superconductor an increasing number of materials scientists and electrical engineers require easy access to practical information sensible advice and guidance on best practice and reliable proven fabrication and characterisation techniques the handbook will be the definitive collection of material describing techniques for the fabrication and analysis of superconducting materials in addition to the descriptions of techniques authoritative discussions written by leading researchers will give guidance on the most appropriate technique for a particular situation characterisation and measurement techniques will form an important part of the handbook providing researchers with a standard reference for experimental techniques the tutorial style description of these techniques makes the handbook particularly suitable for use by graduate students the handbook will be supported by a comprehensive web site which will be updated with new data as it emerges the handbook has six main sections fundamentals of superconductivity characteristic properties elementary theory critical current of type ii superconductors processing bulk materials wires and tapes thick and thin films contact techniques characterisation techniques structure microstructure measurement and interpretation of electromagnetic properties measurement of physics properties materials characteristic properties of low and high T_c materials applications high current applications trapped flux devices high frequency devices josephson junction device
